

A DESCRIPTION OF A PEER-RUN SUPERVISED INJECTION SITE FOR PEOPLE WHO INJECT DRUGS

BACKGROUND & METHOD

- Since the early 1990s, people have called for supervised injection sites (SIS) as a way to fight the ongoing health crisis among people who inject drugs (IDU) in Vancouver.
- In April 2003, a group of advocates opened the "327 SIS", an unauthorized or 'unsanctioned' SIS in the Downtown Eastside (DTES). It operated for 184 days, supervising over 3,000 injections.
- At the same time, the Vancouver Police Department (VPD) started a large-scale crackdown on the DTES' drug market.
- The purpose of this study was to describe the unsanctioned SIS, including its operational design, the individuals accessing the site, and the use of the site.
- A brief survey was given to 100 individuals who accessed the SIS between June 1st and August 27th to describe the group of people using the site. People who worked at the SIS kept a detailed log of the number of people who used the SIS. Historical documentation was gathered and reviewed to get information about the operation and closure of the SIS.

FINDINGS

- The SIS likely improved public health by giving IDU a clean and safe place to inject drugs.
- By allowing IDU to share drugs and assist one another in injecting, the SIS showed the benefits of a 'low-threshold', peer-driven SIS model and the importance of including IDU in the control and operation of SIS.
- Police presence around the SIS had a negative effect on access to SIS.

QUICK FACT

*PUBLIC HEALTH WAS IMPROVED
WHEN IDU WERE GIVEN A CLEAN
AND SAFE PLACE TO INJECT DRUGS
IN A LOW-THRESHOLD, PEER
DRIVEN ENVIRONMENT.*

IMPLICATIONS

- Low-threshold, peer-driven SIS environments were shown to be beneficial in helping local IDU inject safely.
- SIS will be most successful if police activities can be coordinated with health services.
- More should be done to accommodate high-risk IDU within the SIS environment, including those who need help injecting.
